Get Vehicle Inventory Guidelines

Overview

This document is a guideline on how to use the Get Vehicle Inventory Business Object Document (BOD). Get Vehicle Inventory has been defined in the context of STAR for the Automotive Retail Industry. The scope of this BOD is to define the Get Vehicle Inventory process for individual consumers who service their automobiles through their OEM's authorized Dealers. The focus is on Dealer and OEM interactions, not third party organizations. NOTE: Although this is the traditional use of the Get Vehicle Inventory, this BOD could be used to send Get Vehicle Inventory information between any two business parties.

Implementation Guidelines provide detailed information regarding the structure and meaning of the Get Vehicle Inventory BOD and corresponds directly to the Get Vehicle Inventory schema. In addition to structure and meaning, the Implementation Guidelines identify various business rules for specific fields/components that due to their nature, i.e. field interdependence, are not possible to express using schema. Please note that although these business rules are not included in the schema, they <u>MUST</u> be followed to be STAR Compliant. Therefore, the Get Vehicle Inventory Implementation Guidelines must be used in concert with the Get Vehicle Inventory schema during development and should <u>NOT</u> be considered a supplement or substitution to the schema. For more information regarding STAR XML Data Compliance, please review the STAR Data Compliance Guidelines document located on the STAR Web site.

For a copy of the corresponding Get Vehicle Inventory schema, please download the appropriate STAR schema repository from the XML portion of the STAR website (www.starstandard.org). Prior to downloading the schema, users are encouraged to download the STAR XML Reference/Implementation document also located on the XML portion of the STAR website. This document provides an overview of the STAR BOD development methodology, how to download and read STAR schema, and various frequently asked questions related to the implementation of STAR BODs.

STAR has followed the Open Application Group's Business Object Document methodology to develop the Get Vehicle Inventory BOD. Where possible, STAR has mapped to existing OAGI fields and components. Note however that the STAR Get Vehicle Inventory BOD is unique to the Retail Automotive industry and is not an extension of any existing OAGIS BODs.

For more information on the Open Applications Group's BODs and related documentation please refer to the Open Applications Group's Web site at (www.openapplications.org).

Schema Field Usage

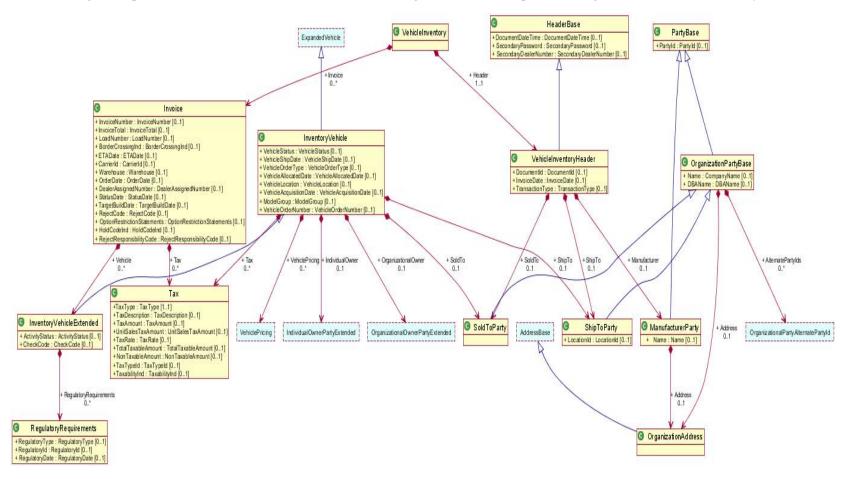

STAR uses the same Noun in the schema for all the Noun/Verb combinations of the Get Vehicle Inventory except the Get verb. Please refer to each Noun/Verb combination within this document to understand the requirements for each specific BOD. Although the Noun will always have every field defined for the Noun in the schema, each Noun/Verb combination may not use all of the fields. If a field is not used by a BOD, it will be noted in the business rules.

Business Scenario

The Get Vehicle Inventory Binary Collaboration starts with the sending of Vehicle Inventory information from the OEM to the Dealer. This process occurs on demand as needed. Note: This scenario is an example of how the Vehicle Inventory BOD can be used. Implemenations may vary. Note only the PartyId to be retrieved needs to be filled in the SoldToParty component.

Relationship Diagram

The following is a representation of the Noun for this BOD. It is a high level overview provided to give an idea of the hierarchy of the Noun's components.

Schema Document Properties

Declared Namespaces

A schema can contain more than one namespace. According to Whatis.com, "In general, a namespace uniquely identifies a set of names so that there is no ambiguity when objects having different origins but the same names are mixed together." An example would be two namespaces that both defined an element called ID, without a namespace it would be impossible to determine which definition was being used.

Prefix Namespace	
Default namespace	http://www.starstandards.org/STAR
xml http://www.w3.org/XML/1998/namespace	
xsd	http://www.w3.org/2001/XMLSchema

Components and Data Types

Global definitions include components, code lists, and data types. Components are used to build the data structures that make up a Noun and it's requirements. Data types specify the type of data that a component's fields may contain. Not all definitions are included in this documentation. Please see either the STAR Code List guideline or Data Type Guidelines for further information.

ApplicationArea

These field(s) use this type: **ApplicationArea.**

Name	ApplicationArea	
Abstract	no no	

Field / Component	Description	R/O	Business Rule
Sender	Identifies characteristics and control identifiers that relate to the application that created the Business Object Document. The sender a can indicate the logical location of the application and/or database so the application, and the task that was processing to create the BOD.		
CreationDateTime	is the date time stamp that the given instance of the Business Object Document was created. This date must not be modified during the little Business Object Document.	R fe of	
Signature	If the BOD is to be signed the signature element is included, otherwis not. Signature supports any digital signature that maybe used by a implementation of OAGIS. The qualifying Agency identifies the age that provided the format for the signature. This element supports any digital signature specification that is available today and in the future. This is accomplished by not actually defining the content but by allot the implementation to specify the digital signature to be used via an external XML Schema namespace declaration. The Signature element defined to have any content from any other namespace. This allows user to carry a digital signature in the xml instance of a BOD. The close of which digital signature to use is left up to the user and their integrated.	nncy e. wing nt is the noice	

Field / Component	Description	R/O	Business Rule
BODId	The BODId provides a place to carry a Globally Unique Identifier (GUID) that will make each Business Object Document instance uniquely identifiable. This is a critical success factor to enable sof developers to use the Globally Unique Identifier (GUID) to build following services or capabilities: 1. Legally binding transactions Transaction logging, 3. Exception handling, 4. Re-sending, 5. Rep 6. Confirmations, 7. Security.	ftware the , 2.	
Destination	Information related to the receiver of the BOD	R

Destination

These field(s) use this type: **Destination.**

Name	Destination
Abstract	no

Field / Component	Description	R/O	Business Rule
DestinationNameCode	Code for destination of file (i.e.Short Manufacturer or DSP code)	O	

Field / Component	Description	R/O	Business Rule
DestinationURI	Physical address of the destination	О	
DestinationSoftwareCode	Additional information about the destination application	О	
DestinationSoftware	For which software destination file is intended (may not be known).	О	
DealerNumber	Target Dealer Code receiving information	О	
StoreNumber	Dealer code store number (DMS assigned)	О	
AreaNumber	Dealer code area number (DMS vendor assigned)	О	
DealerCountry	Target Dealer country location	О	
PartyId	The Party Id field uniquely identifies the Receiver of the message. This element can be used for parties within the Automotive Community as well as external parties. Party Id is not intended as a replacement for the Dealer Number. Suggested formats for OEMs or other large institutions include: DUNs Number, ShortMfgCode + DUNs, or ShortMfgCode. The suggested format for Dealers is: ShortMfgCode+Dealer Number.		
LocationId	The Location Id field uniquely identifies the location of the Receiver of message. This Id may be aligned with a physical address or data centers. This field provides an additional level of granularity beyond the usage of the Party Id for additional routing and deliver of data.		
ServiceId	The Service Id field identifies the particular service to which a message is being sent, e.g., an inventory service.	0

ExpandedVehicle

Name	ExpandedVehicle
Abstract	no no

Field / Component	Description	R/O	Business Rule
Model	Manufacturer-assigned model code of vehicle - Usually available in the VIN number (use NCIC code)	0	
ModelYear	Vehicle designated model year	О	
ModelDescription	Descriptive vehicle model name	О	
Make	Vehicle make code - Usually available in the VIN number (use NCIC code).	·	
SaleClass	Class of Sale	О	
Condition	Condition of Vehicle - Example: Excellent, Good, Fair, Poor, Unknown	О	
CertifiedPreownedInd	Identifies as a certified Pre-Owned Vehicle	О	
VehicleNote	Any vehicle related notes	О	
VIN	Federally defined 17 position vehicle identification number	О	
DeliveryMileage	Odometer reading of vehicle at time of delivery	О	
VehicleStock	Dealer assigned vehicle stock number	О	
TrimCode	Manufacturer assigned trim code	О	
DoorsQuantity	Number of doors on vehicle	О	
BodyStyle	Manufacturer-assigned vehicle body style	О	
InteriorColor	Vehicle Interior Color(s)	О	
ExteriorColor	Vehicle Exterior Color(s)	О	
TransmissionType	Vehicle Transmission type	О	

Field / Component	Description	R/O	Business Rule
OdometerStatus	Status of odometer at trade-in. Example:: Replaced, Tampered, Miles> 90,000, etc.	О	
NonUSVehicleInd	Indicates whether the vehicle was produced for the United States or not	O	
VehicleDemoInd	Indicates whether vehicle was ever a demo	O	
LicenseNumber	State License plate number of vehicle	O	
BrandedInfo	Vehicle Branding Information	O	
RestrictionInd	Indication that vehicle has restrictions on its use	O	
RestrictionDescription	Description of vehicle use restrictions	О	
TelematicsServiceInd	Indication whether Telematics Service Subscription is turned on	О	
Option	Vehicle Options	О	
TransmissionCode	Transmission Serial Number	О	
DeliveryDate	The date of original retail vehicle sale	О	
EngineNumber	Serial number of the engine if vehicle not made for US sale	О	
IgnitionKeyNumber	Vehicle Ignition Key Number	О	
AxleCode	The code on the axle of the vehicle.	О	
FleetAccount	Manufacturer defined fleet account number	О	
FleetVehicleId	Uniquely identifies the vehicle as part of a fleet company	О	
FleetPurchaseOrderNumber	Fleet Purchase Order Number vehicle was purchased under	О	
DoorKeyNumber	Door key number	О	
VehicleWeight	Vehicle weight	О	
ExteriorColorCode	Vehicle exterior color code	О	
InteriorColorCode	Vehicle Interior color code	О

ReturnCriteria	ReturnCriteria identifies the content that is to be returned, given query success. In essence, the expression here has the effect of filtering the part(s) of the found element(s) that are to be returned. ReturnCriteria plays no role in the query itself. That is handled as a match against the request BOD's noun exemplar. ReturnCriteria allows the sender of the BOD to indicate which information (down to the field level) is requested to be returned, given that the query has been successful in matching the exemplar to existing nouns. That is, in a GetListPurchaseOrder, if one or more PurchaseOrders with a TotalPrice = \$1M were found, ReturnCriteria tells the BOD recipient which parts of the PurchaseOrder should be populated with content when the response (ShowPurchaseOrder) is formulated. The expressionLanguage indicates the expression language being used. In order for the ReturnCriteria expression to be evaluable by the BOD recipient, the recipient must be capable of processing and interpreting the specified expression language XPath is the default, due to its ubiquity among XML processing technologies.

Abstract	no

Field / Component	Description	R/O	Business Rule
Get	The Get verb is to communicate to a business software component a request for an existing piece of information to be returned. The Get may be paired with most of the nouns defined in the OAGIS specification. The response to this request is the Show verb. The behavior of a BOD with a Get verb is quite predictable across most of the nouns it may be paired with. The Get is designed to retrieve a single piece of information by using that information's primary retrieval field, or key field. The Get ver is not used to request several documents at once. The GetList verb is designed to achieve that purpose and will be covered in more detail later. Selection Criteria: There are two types of selection capabilities for most BOD's that use the Get verb. 1) The first selection capabilities for most BOD's that use the Get verb. 1) The first selection capabilities for most BOD and used to provide the Field-Based Selection capabilities commonly used to provide the Field-Based Selection criteria. This is always defined within the specific BOD and is commonly the required fields for that specific Data type. The Field-Based Selection enables the requester to provide a value or values (in the case of multiple required Field Identifiers), in the required fields. Then the responding component uses those values to find and return the requested information to the originating business software component. 2) The second type of selection capability for Get-based BODs is called Data Type Selection. Data Type selection enables the requester to identify which Data Types within the noun are requested to be returned in the response. The use of this capability is described for each corresponding Data Type for all BODs that use the Get verb. The Data Types are identified for retrieval within the Get instance of a BOD by including the name of the Data Type in the meta data but without any Field Identifiers or Segments identified within the Data Type. This will signify to the responding application that all of the data that corresponds to that Da	e b b

RequestVerb

Na	ame	RequestVerb
Ak	ostract	no

Data Elements and Components

Field / Component	Description	R/O	Business Rule
Verb		R	
ReturnCriteria	ReturnCriteria identifies the content that is to be returned, given query success. In essence, the expression here has the effect of filtering the part(s) of the found element(s) that are to be returned. ReturnCriteria plays no role in the query itself. That is handled as a match against the request BOD's noun exemplar. ReturnCriteria allows the sender of the BOD to indicate which information (down to the field level) is requested to be returned, given that the query has been successful in matching the exemplar to existing nouns. That is, in a GetListPurchaseOrder, if one or more PurchaseOrders with a TotalPrice = \$1M were found, ReturnCriteria tells the BOD recipient which parts of the PurchaseOrder should be populated with content when the response (ShowPurchaseOrder) is formulated. The expressionLanguage indicates the expression language being used. In order for the ReturnCriteria expression to be evaluable by the BOD recipient, the recipient must be capable of processing and interpreting the specified expression language XPath is the default, due to its ubiquity among XML processing technologies.

Data Elements and Components

Field / Component	Description	R/O	Business Rule
LogicalId	Provides the logical location of the server and applications from the Business Object Document originated. It can be used to establicate to physical mapping, however its use is optional. Each system should maintain an external central reference table containing the logical names or logical addresses of the application to be mapped to the physical network addresses of the resources on the network. Note: The technical implementation of this Doma Naming Service is not dictated by this specification. This logical physical mapping may be done at execution time by the application or by a middleware transport mechanism, depending on the integral architecture used. This provides for a simple but effective director access capability while maintaining application independence from physical location of those resources on the network	lish a stem or ence lication names needed nin to on itself ration	
Component	Provides a finer level of control than Logical Identifier and repres business application that issued the Business Object Document. In optional. For STAR's use this is the DCS Software code name		
Task	Describes the business event that initiated the need for the Busine Object Document to be created. For STAR, the task is defined in Implementation Guidelines for each BOD. It is usually a short description of the BOD. Ex: SalesLead, CreditDecision, etc.		
ReferenceId	Enables the sending application to indicate the instance identifier event or task that caused the BOD to be created. This is used to ca response BOD to an originating BOD		
AuthorizationId	Identifyies the authorization level of the user or application that is sending the Business Object Document Message. This authorization being recognized be the receiving system indicates what can be defined the receiving system. For STAR, this is the User ID.	on level	
CreatorNameCode	DCS Software Creator Code	R	
SenderNameCode	Additional information about the sending platform (i.e., Short MI DSP code).	FG or R	
SenderURI	Physical address of the sender	О	
DealerNumber	Dealer Code of source of information	О	

Field / Component	Description	R/O	Business Rule
StoreNumber	Dealer code store number (DMS assigned)	О	
AreaNumber	Dealer code area number (DMS vendor assigned)	О	
DealerCountry	Source Dealer country location	О	
Language	This code is used to define the language of the data used in this transaction	О	
DeliverPendingMailInd	Indicates if the user requests to receive pending mail that has been store and has yet not been delivered yet. By selecting 0, the user will only receive the response for the current transaction the user is performing.	ed O	
Password	Token for application specific authentication. Used to authenticate dealership/users through application specific security	О	
SystemVersion	The sender's software version number.	О	
PartyId	The Party Id field uniquely identifies the Sender of the message. This element can be used for parties within the Automotive Community as well as external parties. Party Id is not intended as a replacement for the Dealer Number. Suggested formats for OEMs or other large institutions include: DUNs Number, ShortMfgCode + DUNs, or ShortMfgCode. To suggested format for Dealers is: ShortMfgCode+Dealer Number.	S	
LocationId	The Location Id field uniquely identifies the location of the Sender of a message. This Id may be aligned with a physical address or data center. This field provides an additional level of granularity beyond the usage the Party Id for additional routing and deliver of data.	s.	
ServiceId	The Service Id field identifies the particular service from which a message is being sent, e.g., an inventory service.	О

Data Elements and Components

Field / Component	Description	R/O	Business Rule
LogicalId	Provides the logical location of the server and applications from which the Business Object Document originated. It can be used to establish a logical to physical mapping, however its use is optional. Each system of combination of systems should maintain an external central reference table containing the logical names or logical addresses of the application systems in the integration configuration. This enables the logical name to be mapped to the physical network addresses of the resources needed on the network. Note: The technical implementation of this Domain Naming Service is not dictated by this specification. This logical to physical mapping may be done at execution time by the application its or by a middleware transport mechanism, depending on the integration architecture used. This provides for a simple but effective directory access capability while maintaining application independence from the physical location of those resources on the network	r on S d	
Component	Provides a finer level of control than Logical Identifier and represents to business application that issued the Business Object Document. Its use optional. For STAR's use this is the DCS Software code name		
Task	Describes the business event that initiated the need for the Business Object Document to be created. For STAR, the task is defined in the Implementation Guidelines for each BOD. It is usually a short description of the BOD. Ex: SalesLead, CreditDecision, etc.	R	
ReferenceId	Enables the sending application to indicate the instance identifier of the event or task that caused the BOD to be created. This is used to correla a response BOD to an originating BOD		
AuthorizationId	Identifyies the authorization level of the user or application that is sending the Business Object Document Message. This authorization le being recognized be the receiving system indicates what can be done o the receiving system. For STAR, this is the User ID.

LicenseNumber

These field(s) use this type: **LicenseNumber.**

State License plate number of vehicle

Name LicenseNumber

Base XSD Type: string

LoadNumber

These field(s) use this type: **LoadNumber.**

Shipment carrier-assigned load number

Name LoadNumber

Base XSD Type: string

Make

These field(s) use this type: Make.

Vehicle make code - Usually available in the VIN number (use NCIC code).

Name Make

Base XSD Type: string

Manufacturer

These field(s) use this type: Manufacturer.

Manufacturer Name

Name Manufacturer

Base XSD Type: string

ManufacturerInstalledInd

These field(s) use this type: **ManufacturerInstalledInd.**

Indicates manufacturer-installed accessories

Name	ManufacturerInstalledInd	
Base XSD Type: string		
Code Value	Description	
1		

MarketingMailInd

These field(s) use this type: ${\bf \underline{MarketingMailInd,MarketingMailInd.}}$

Indicates customers whom have requested no marketing mail

Name	MarketingMailInd	
Base XSD Type: string		
Code Value	Description	
0		
1		

MiddleName

These field(s) use this type: **MiddleName.**

Middle Initial of business party

Name MiddleNar

Base XSD Type: string

MileageMeasure

M = Miles, K = KIlometers

Name	MileageMeasure	
Base XSD Type: string		
Code Value		Description
M "M" = Modified		"M" = Modified
K		Kilometers

MiscellaneousCode

These field(s) use this type: MiscellaneousCode.

Miscellaneous code

Name MiscellaneousCode

Base XSD Type: string

Model

These field(s) use this type: **Model.**

Manufacturer-assigned model code of vehicle - Usually available in the VIN number (use NCIC code)

Name Model

Base XSD Type: string

ModelDescription

These field(s) use this type: **ModelDescription.**

Descriptive vehicle model name

Name ModelDescription

Base XSD Type: string

ModelYear

These field(s) use this type: **ModelYear.**

Vehicle designated model year

Name ModelYear

Base XSD Type: gYear

Name

These field(s) use this type: <u>Name, GivenName, Family Name, Formatted Name</u>.

Name of the Party.

Name Name

Base XSD Type: string

NonUSVehicleInd

These field(s) use this type: **NonUSVehicleInd.**

Indicates whether the vehicle was produced for the United States or not

Name	NonUSVehicleInd
Base XSD Type: string	
Code Value	Description
0	
1	

Note

A free form note.

Name	Note
INAIIIC	14016

Base XSD Type: string

OdometerStatus

These field(s) use this type: **OdometerStatus.**

Status of odometer at trade-in. Example:: Replaced, Tampered, Miles> 90,000, etc.

Name

OdometerStatus

Base XSD Type: string

OptionName

These field(s) use this type: **OptionName.**

Name of vehicle option

Name

OptionName

Base XSD Type: string

OptionNotes

These field(s) use this type: **OptionNotes.**

Free form text related to option

Name

OptionNotes

Base XSD Type: string

OptionOrigin

These field(s) use this type: **OptionOrigin.**

Identifies the option installer

Name

OptionOrigin

Base XSD Type: string

OptionSalesCode

These field(s) use this type: **OptionSalesCode.**

Further definition of accessories and option packages - Indicates whether ordered option, special package, standard, etc.

Name

OptionSalesCode

Base XSD Type: string

OptionSecurityCode

These field(s) use this type: **OptionSecurityCode.**

Security code to unlock option. (i.e, radio code)

Name

OptionSecurityCode

Base XSD Type: string

OptionSerialNumber

These field(s) use this type: **OptionSerialNumber.**

Serial number of Option

Name

OptionSerialNumber

Base XSD Type: string

OptionStockNumber

These field(s) use this type: **OptionStockNumber.**

Stock Number of Vehicle Option

Name

OptionStockNumber

Base XSD Type: string

OrderDate

These field(s) use this type: **OrderDate.**

Date order originally placed

Name OrderDate

Base XSD Type: date

PartType

These field(s) use this type: **PartType.**

Specifies whether the parts are indicated by manufacturer part code or Part Number - H = Manufacturer Part Code, P = Part Number

Name	PartType	
Base XSD Type: string		
Code Value Description		Description
Н		Manufacturer Part Code
P		"P" = Pending

PortInstalledInd

These field(s) use this type: **PortInstalledInd.**

Indicates Port-installed accessories

Name	PortInstalledInd

Fields and Global Attributes

Global declarations are items such as elements, attribute groups, and group definitions. These items are not defined within any particular component. A component may reference these definitions. Within a STAR XML Schemas these are typically known as global fields.

ApplicationArea

These field(s) use this type: **ApplicationArea**.

Provides the information that an application may need to know in order to communicate in an integration of two or more business applications. The ApplicationArea is used at the applications layer of communication. While the integration frameworks web services and middleware provide the communication layer that OAGIS operates on top of.

Provides the information that an application may need to know in order to communicate in an integration of two or more business applications. Get

These field(s) use this type: $\underline{Get.}$

The Get verb is to communicate to a business software component a request for an existing piece of information to be returned. The Get may be paired with most of the nouns defined in the OAGIS specification. The response to this request is the Show verb. The behavior of a BOD with a Get verb is quite predictable across most of the nouns it may be paired with. The Get is designed to retrieve a single piece of information by using that information's primary retrieval field, or key field. The Get verb is not used to request several documents at once. The GetList verb is designed to achieve that purpose and will be covered in more detail later. Selection Criteria: There are two types of selection capabilities for most BOD's that use the Get verb. 1) The first selection capability is called Field-Based Selection. Within a Get-based Business Object Document, the first Data Type that occurs in a specific BOD structure is commonly used to provide the Field-Based Selection criteria. This is always defined within the specific BOD and is commonly the required fields for that specific Data type. The Field-Based Selection enables the requester to provide a value or values (in the case of multiple required Field Identifiers), in the required fields. Then the responding component uses those values to find and return the requested information to the originating business software component. 2) The second type of selection capability for Get-based BODs is called Data Type Selection. Data Type selection enables the requester to identify which Data Types within the noun are requested to be returned in the response. The use of this capability is described for each corresponding Data Type for all BODs that use the Get verb. The Data Types are identified for retrieval within the Get instance of a BOD by including the name of the Data Type in the meta data but without any Field Identifiers or Segments identified within the Data Type. This will signify to the responding application that all of the data that corresponds to that Data Typ
